

Applications Lab 1 – Automate Tasks, Drive Efficiency, and Improve Decision-Making with AI Agents

Introduction

In this Lab covering different areas of Oracle Fusion Cloud Applications, you will discover examples of built-in AI, and follow this step-by-step guide to what you could see as a “Day in an AI Assisted Worklife”.

Casey Brown is a Senior Business Operations Manager at VisionCorp, a growing enterprise preparing for an important quarter-end review. Casey works across sales, finance, procurement, HR, and compliance teams to keep key business activities moving smoothly.

In this lab, participants will step into Casey’s role as he supports a high-priority sales opportunity, communicates with colleagues, reviews purchase requisition guidance, contributes to access certification activities, and analyzes financial performance using EPM insights.

Casey’s day shows how AI can help a busy business leader make faster decisions, improve communication, reduce manual effort, and spot important risks or opportunities across connected Oracle Cloud processes.

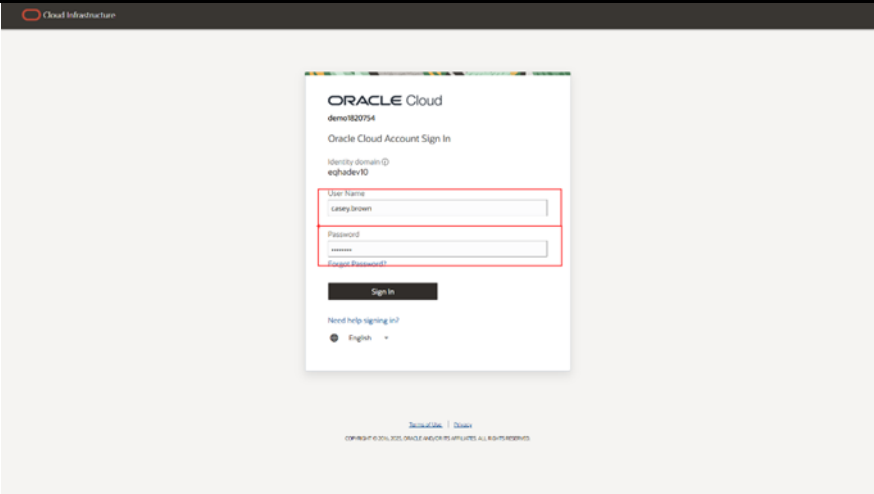

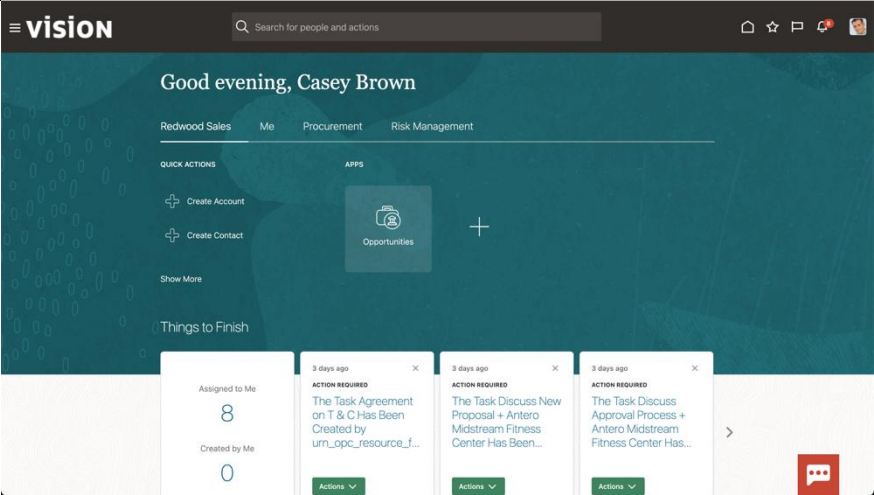

Lab 1 - Explore pre-built AI features in Fusion Cloud Applications

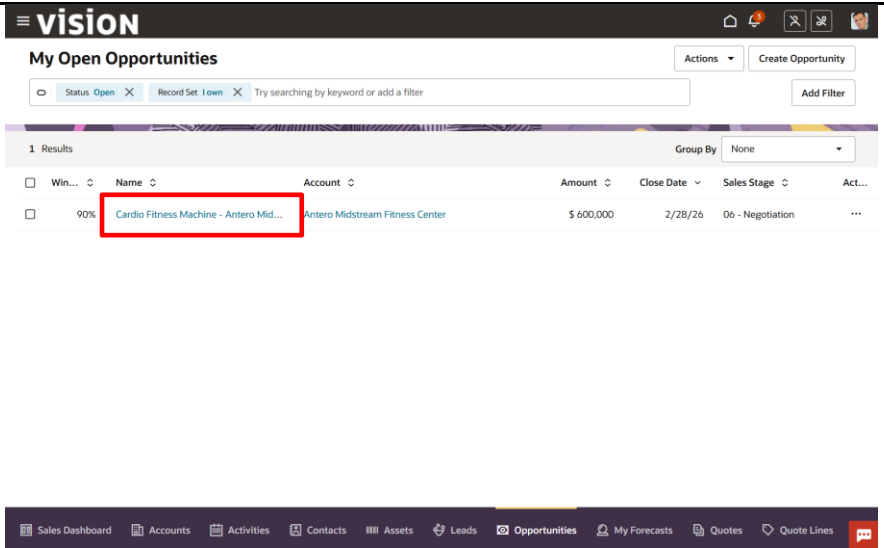

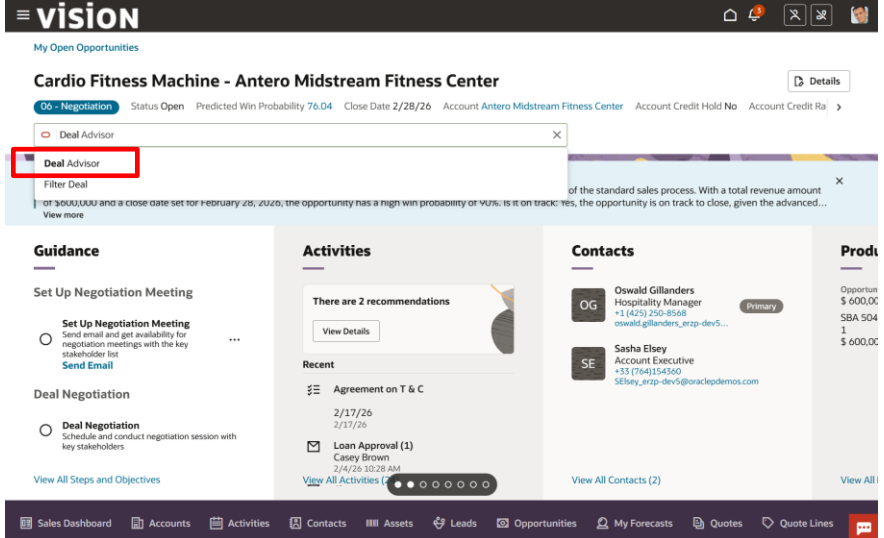

Overview

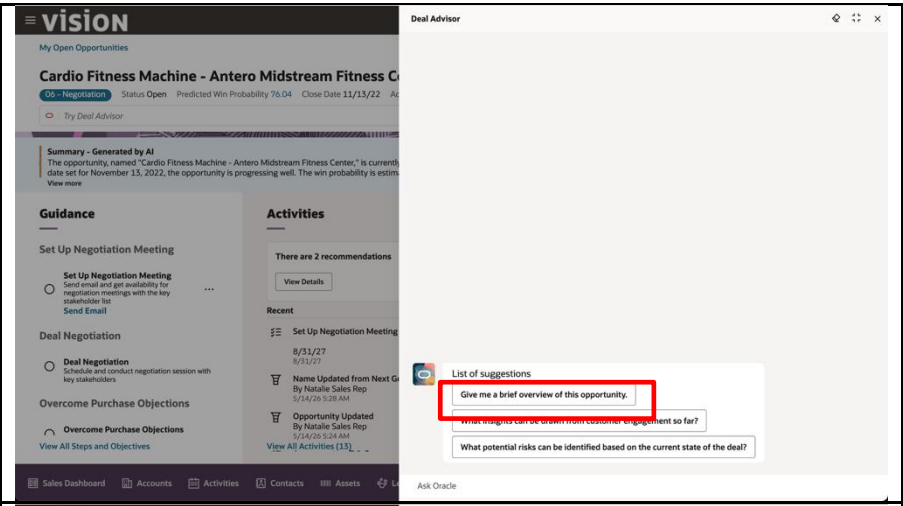

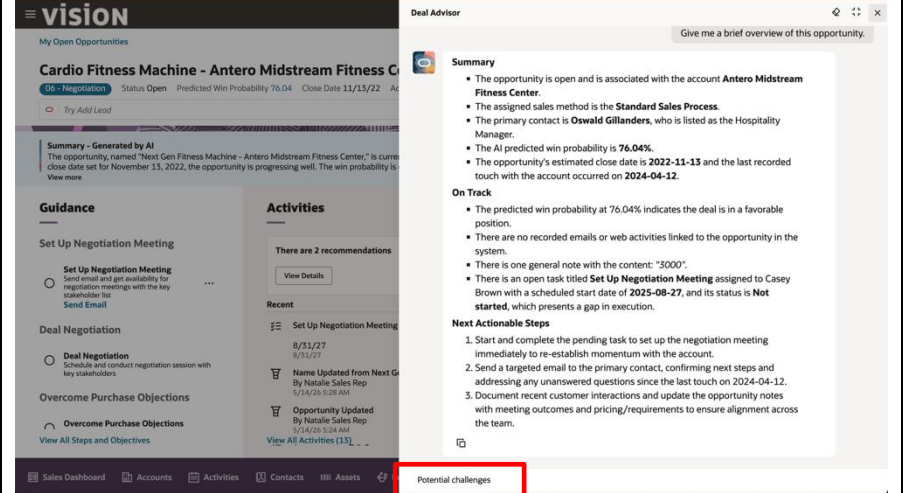

The AI Experience Applications Lab 1 is a 60-minute, hands-on journey through five practical ways AI can help people work smarter across Oracle Cloud. You will explore how Oracle embedded AI can:

- 1) support sales teams with a Deal Advisor agent and opportunity-related email drafting in Sales Cloud,
- 2) help managers give thoughtful feedback to colleagues in HCM Cloud,
- 3) simplify policy guidance and summarisation in purchase requisitioning in Procurement Cloud,
- 4) strengthen access certification reviews with Generative AI in Risk Management Cloud,
- 5) uncover business insights through EPM Cloud anomaly detection.

Together, these exercises show how pre-built, embedded AI can streamline everyday decisions, improve productivity, and create more intuitive experiences across the enterprise.

Exercise 1-1: Sales Follow Ups (Customer Experience, CX)		
Background	Participant Action	Display
Login to the Oracle Cloud ERP: https://fa-erzv-dev27-saasfademo1.ds-fa.oraclepdemos.com/fscmUI/faces/UseWelcome?_afndThemeName=VisionDefault All workshop attendees will start by using the same user. Please do not change, save, or submit any work as this will interfere with other participants. Performance is likely to be significantly slower than in your production environments, please be patient...	Login with the credentials: User ID: casey.brown Password: <i>Use the environment password</i>	
	<i>Clicks:</i> Select Redwood Sales then Opportunities	

The list is opened pre-filtered to show opportunities relevant to work with.	<i>Clicks:</i> <i>Select</i> <i>“Cardio Fitness Machine - Antero Midstream Fitness Center”</i>	
Let's see how AI assesses opportunities in real-time using the Deal Advisor AI agent to get insights based on current and historical sales data, customer insights, engagements, deal progress and all the opportunity-related data The agent helps sellers and their managers identify upsell potential, mitigate risks, develop strategies based on similar won opportunities, suggest next best actions and more.	<i>Clicks:</i> <i>In the search, type “Deal Advisor”</i> <i>Select “Deal Advisor” from the drop down</i> 	

When the agent opens, I am met with suggestions. These guide me to areas of value within the deal. (If an error message is displayed saying the assistant is not available, try logging off and on again ☺)	<i>Clicks:</i> <i>Select the first suggestion</i>	
The deal advisor delivers actionable insights to sales teams, accelerates deal cycles, and improves win rates by helping sellers focus on the right actions at the right time. Managers can use the agent to get brief but comprehensive insights into the deal, customer engagements, and proactively identify risks. It can also generate follow-up questions based on the information generated (Note that your response is probably different to the screen example.)	<i>Clicks</i> <i>Type “Potential Challenges” in Ask Oracle</i> 	

Using historical references, data within the opportunity, and data from ongoing deals, the agent is able to prioritize next steps in order to close this deal. Notice one of the recommendations is to follow up with the customer.

Clicks:
Click the 'X' in the top right of the agent

The screenshot shows the Oracle AI in Action interface for a deal titled "Cardio Fitness Machine - Antero Midstream Fitness Center". The deal status is "Open - Negotiation" with a predicted win probability of 75.04% and a close date of 11/13/22. The interface is divided into two main sections: "Guidance" and "Activities".

Guidance: This section lists several tasks: "Set Up Negotiation Meeting", "Deal Negotiation", "Overcome Purchase Objections", and "Overcome Purchase Objections". Each task has a brief description and a "Send Email" button.

Activities: This section shows a list of recent activities, including "Set Up Negotiation Meeting" (8/31/27), "Name Updated from Next Gen..." (8/31/27), and "Opportunity Updated" (8/31/27).

Deal Advisor: A sidebar on the right provides a summary of the deal, including a list of "Next Actionable Steps" and "Potential challenges". The "Next Actionable Steps" include: "1. Start and complete the pending task to set up the negotiation meeting immediately to re-establish momentum with the account.", "2. Send a targeted email to the primary contact, confirming next steps and addressing any unanswered questions since the last touch on 2024-04-12.", and "3. Document recent customer interactions and update the opportunity notes with meeting outcomes and pricing/requirements to ensure alignment across the team." The "Potential challenges" section lists several items, including the opportunity's estimated close date of 2022-11-13, which is in the past, and the lack of recorded emails or web activities.

Finally, the AI agent can even help me draft an email to Oswald to schedule that meeting!

(Note in the first pane for Guidance, that Send Email is also a direct action under Set Up Negotiation Meeting which will generate a full text proposal)

Clicks:
In the search bar type in "send email"
Select "Send Email" from the drop down

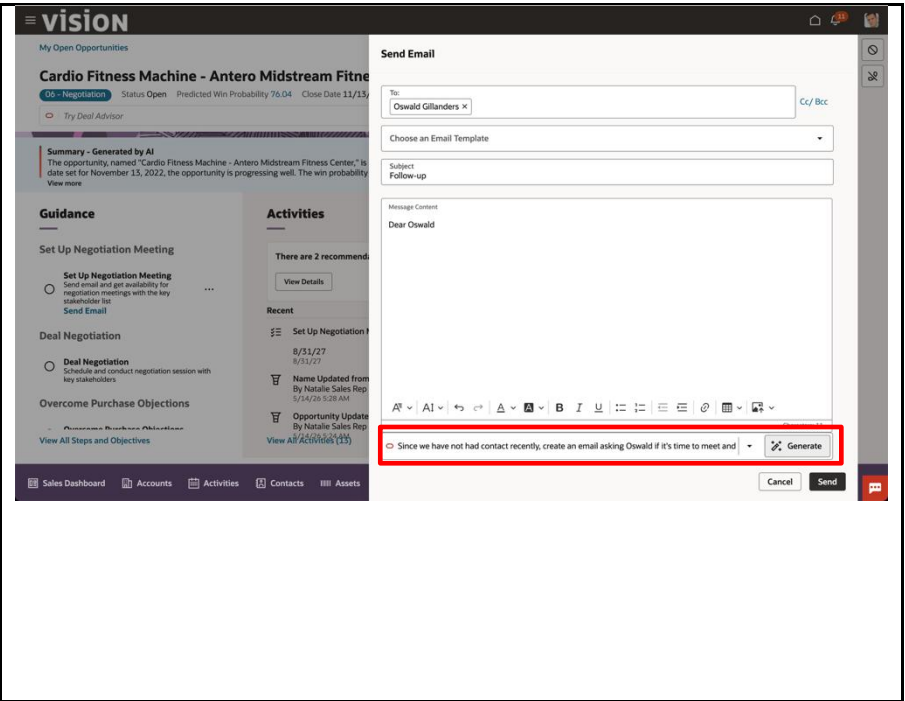

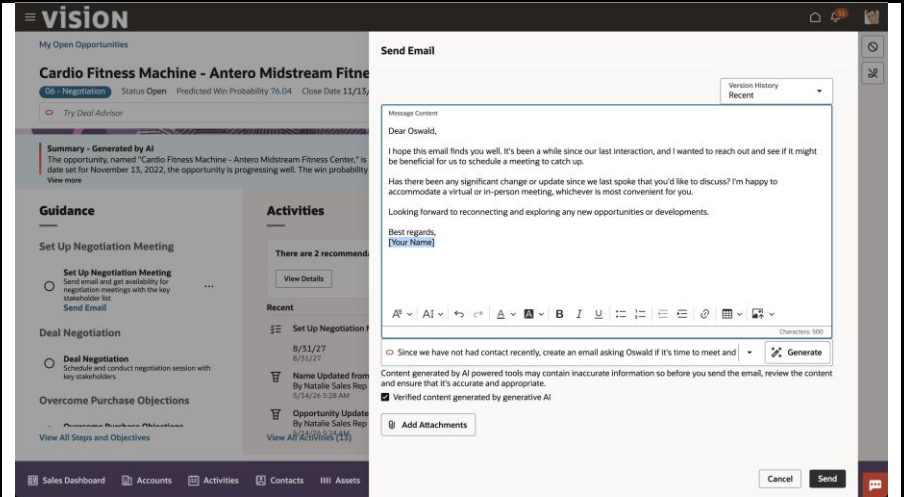

The screenshot shows the Oracle AI in Action interface for a deal titled "Cardio Fitness Machine - Antero Midstream Fitness Center". The deal status is "Open - Negotiation" with a predicted win probability of 75.04% and a close date of 11/13/22. The interface is divided into two main sections: "Guidance" and "Activities".

Guidance: This section lists several tasks: "Set Up Negotiation Meeting", "Deal Negotiation", "Overcome Purchase Objections", and "Overcome Purchase Objections". Each task has a brief description and a "Send Email" button.

Activities: This section shows a list of recent activities, including "Set Up Negotiation Meeting" (8/31/27), "Name Updated from Next Gen..." (8/31/27), and "Opportunity Updated" (8/31/27).

Search Bar: A search bar is located at the top of the interface, with the text "Send Email" entered. A dropdown menu is visible, showing the "Send Email" option selected.

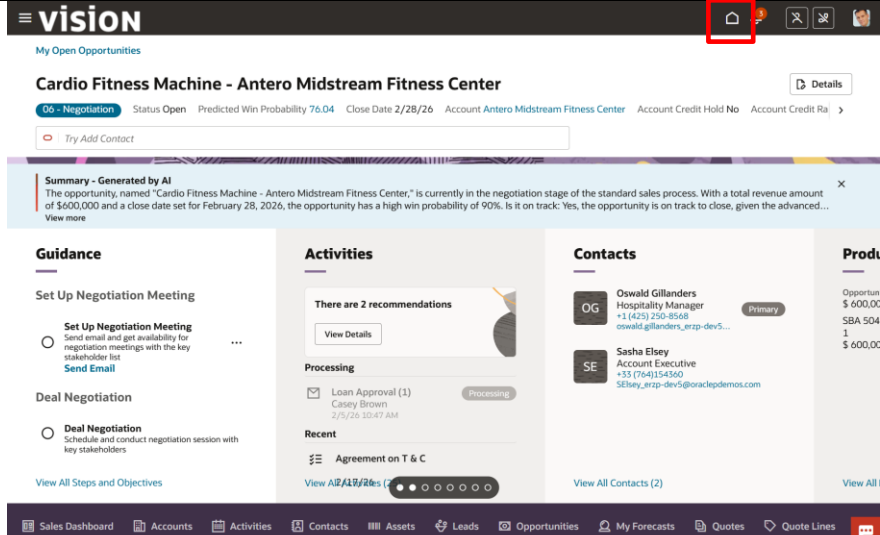

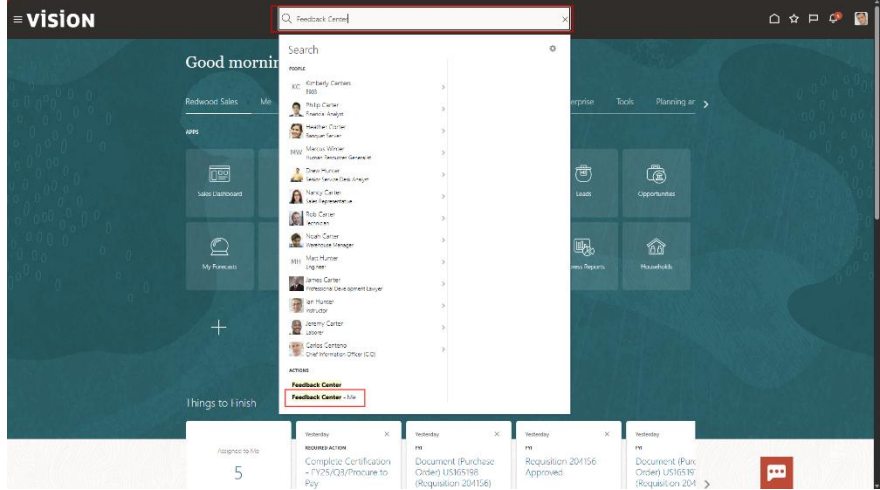

Contacts: A sidebar on the right displays a list of contacts, including "Oswald Gillanders" (Hospitality Manager), "Sasha Elsey" (Account Executive), and "Patrick S. Harrison" (Research and Design). Each contact has a brief description and a "Send Email" button.

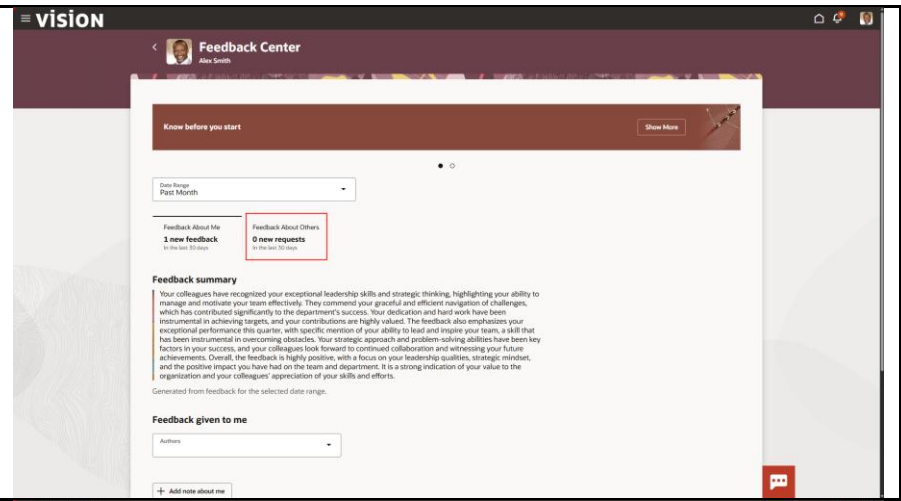

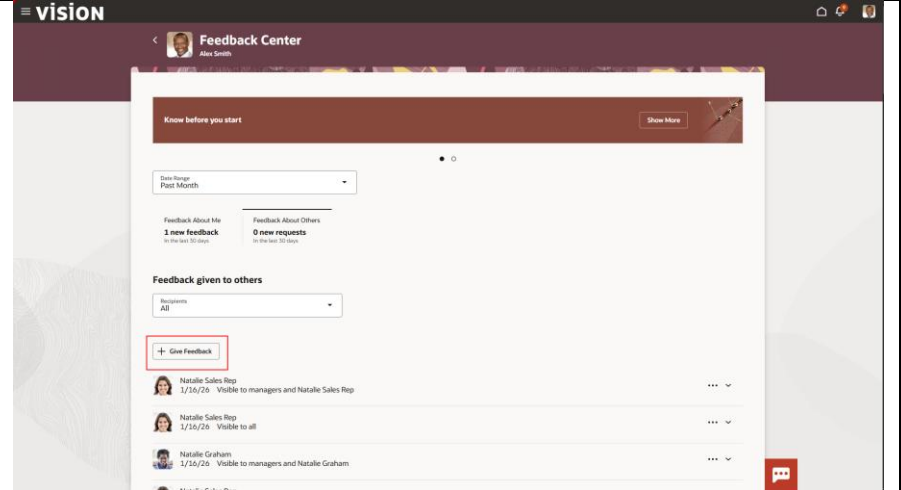

We will utilize the built in AI to generate an email and automatically send it to our customer. (You need to type for example 'Dear Oswald' in the Message Content box before being able to enter text in the AI bar at the bottom, as shown in the screenshot.)	Clicks 1. Do not chose an Email Template 2. Add a subject like "Follow-up" 3. Type 'Dear Oswald' in the Message Content box. 4. In the AI bar at the bottom of the email editor type, "Since we have not had contact recently, create an email asking Oswald if it's time to meet and if anything has changed since our last interaction." 5. Select "Generate"	
Generative AI utilized within the same context, still allowing and even requiring you to amend and refine as needed, based on company policy. It is now time to provide feedback for the new sales rep that was on site.	Clicks 6. Amend [Your Name] to 'Casey Brown' 7. Tick 'Verified content generated by generative AI' 8. Send email. 	

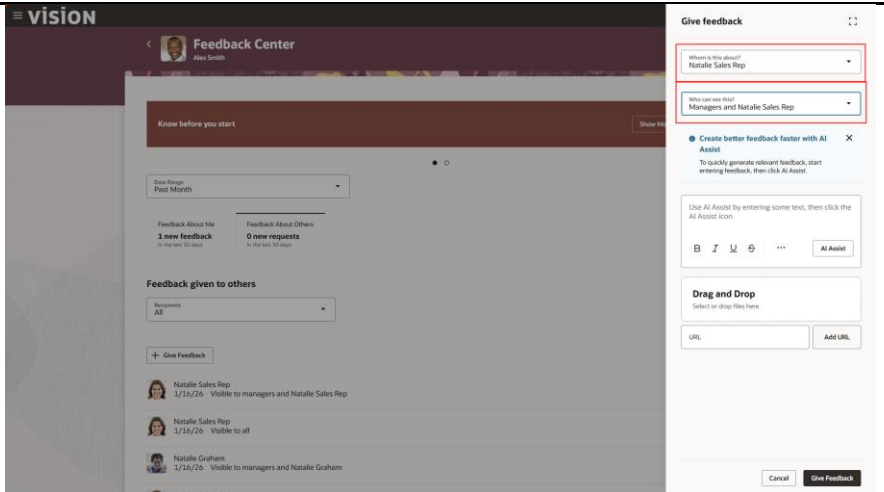

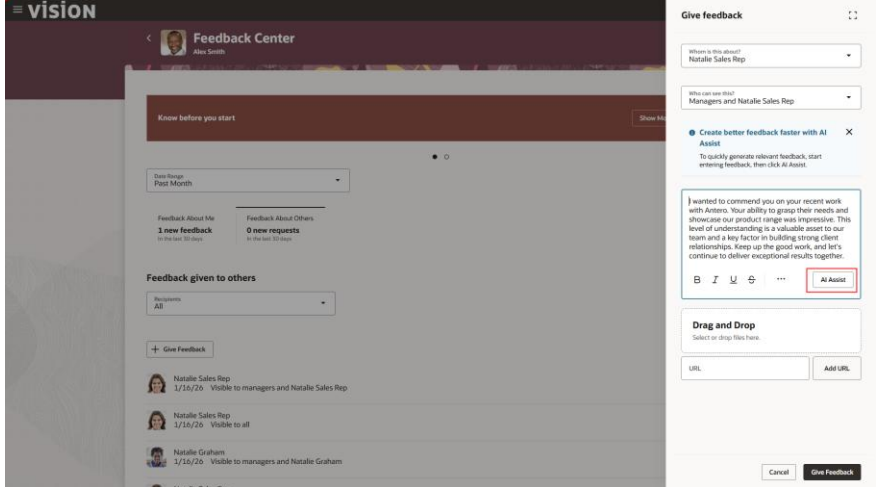

Sales Follow Ups

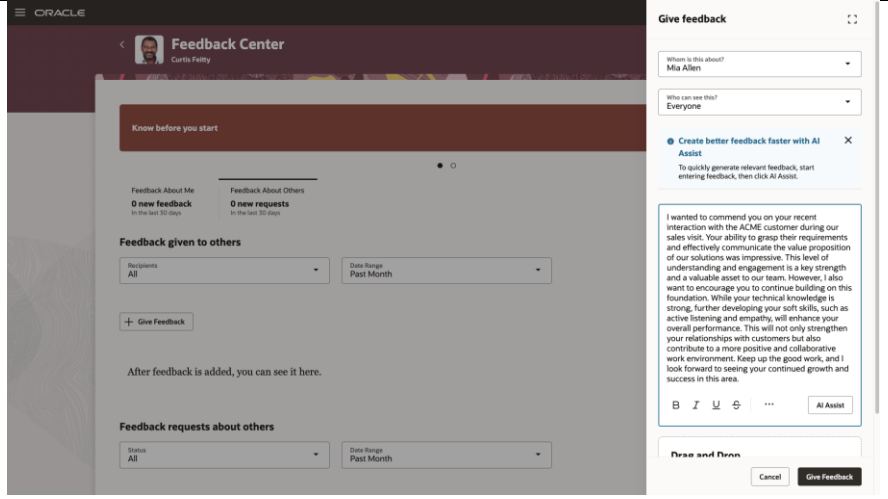

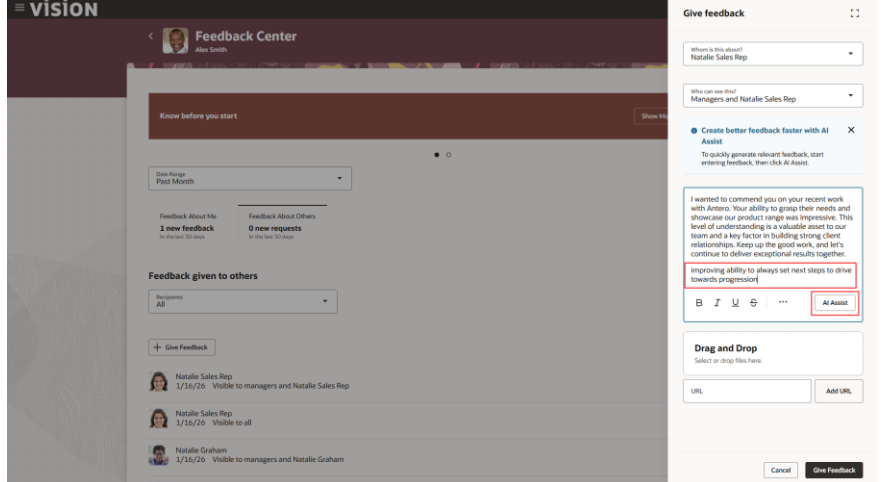

In this exercise, you learnt how to use AI agents to get a quick summary with recommendations and next steps as well as drafting a customer e-mail based on data accessed directly in the CRM system.

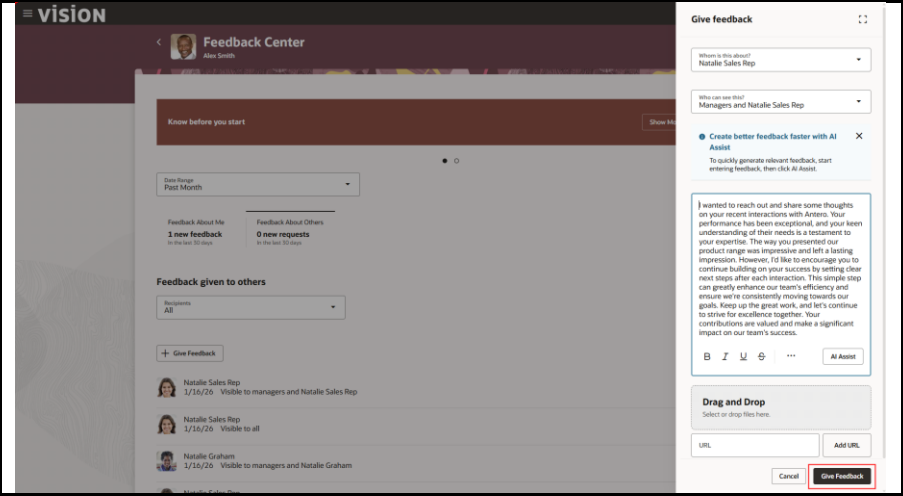

Exercise 1-2: Generate Feedback (Human Capital Management, HCM)

Background	Participant Action	Display
Now that we've updated the sales opportunity, we want to provide feedback for a sales rep that had an impact with the customer.	Clicks: Click the home button	
You are easily able to find areas you're looking for within the system utilizing the navigation tools built into the UI. (Another Navigation path to find the Feedback Center is to look under the tab 'Me' and 'Career and Performance')	Clicks: Using Global Search: Feedback Center – Me Select “Feedback Center - Me” from the drop down	

Once in the feedback center, you'll be able to see the history of feedback given to you, or feedback that you've given to others. This allows for a one-stop-shop for users to view all their related feedback.	Clicks: <i>Select Feedback about others</i>	
	Clicks: <i>Select Give Feedback</i>	

There are different options when it comes to who gets feedback, and how it's viewed by the business. Since this is part of the unified suite, it's easy to find your team.	Clicks: 1. <i>Search & select employee: Natalie SalesRep</i> 2. Define visibility – Managers and Natalie 3. Enter feedback starting point	
Utilizing the built in AI, it makes it much easier to issue feedback. Instead of having to type an entire paragraph, you can provide a couple of key words or phrases and the built in AI tool will generate the rest.	Clicks: 1. <i>Type in “Great job with Antero. You showed ability to understand their needs and know our products well.”</i> 2. <i>Select AI Assist</i> 3. <i>There isn't any constructive feedback. Type at the bottom of the message “Need to construct next steps more clearly, define action items”</i> 4. <i>Select AI Assist</i> 	

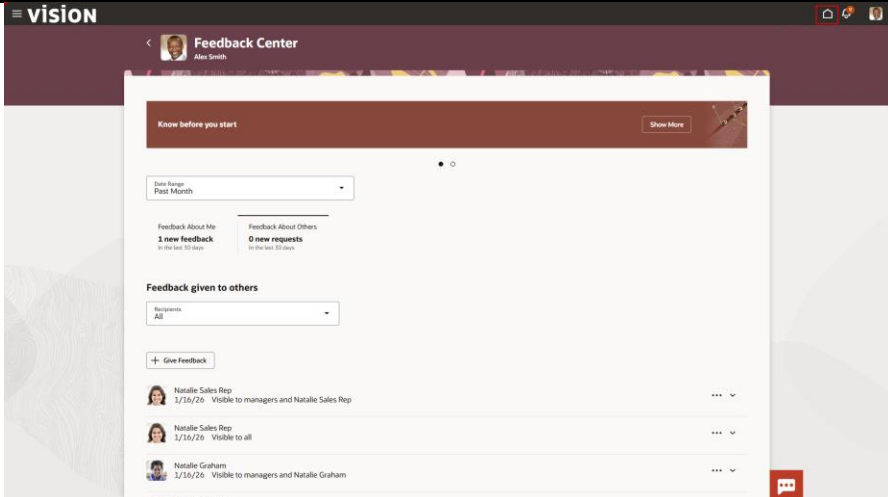

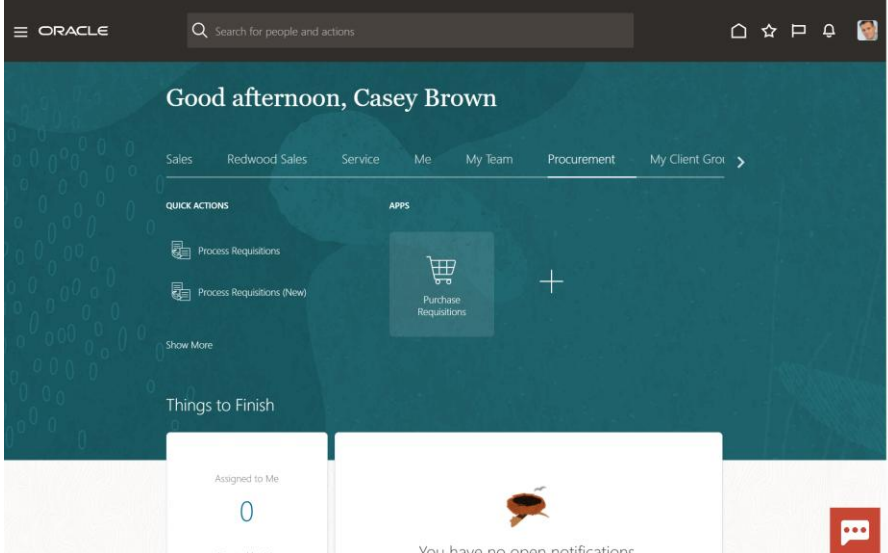

The AI tool will wait for final approval from the user before posting the feedback. This is important because it ensures that the user has final say over what the AI generates.		 direc
Casey values positive feedback but also likes to give constructive feedback so colleagues can always be learning and growing. He notices the generated feedback does not include anything constructive, so he needs to add more	Clicks: 1. Add in additional context 2. Add a space beneath the initial paragraph 3. Type in something along the lines of “improving ability to always set next steps to drive towards progression” 4. Select AI Assist 	

Similar to the positive feedback, the AI tool generates additional context for the sales associate to focus on to continue to grow. Now that the embedded AI has generated feedback, we need to check on a requisition for a laptop that we recently ordered.	<i>Clicks</i> Select give feedback	
---	--	---

Generate Feedback

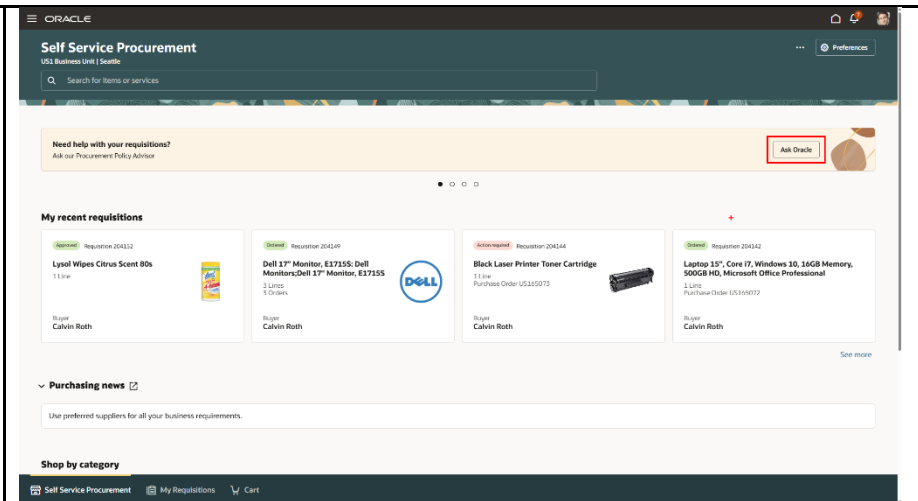

In this exercise, you learnt how to use Generative AI to formulate helpful feedback to a colleague, without taking data or copying text outside your HR system.

Exercise 1-3: Purchase Requisition Guidance (Procurement, ERP/SCM – Supply Chain Management)

Background	Participant Action	Display
On a recent sales trip, Casey damaged his laptop so needed to order a new one. He utilizes the purchase requisition tool to accomplish this.	Click the home button	
To begin the requisition process, he needs to access the purchase requisition landing page	Clicks: <i>Click on Procurement -> Purchase Requisitions</i>	

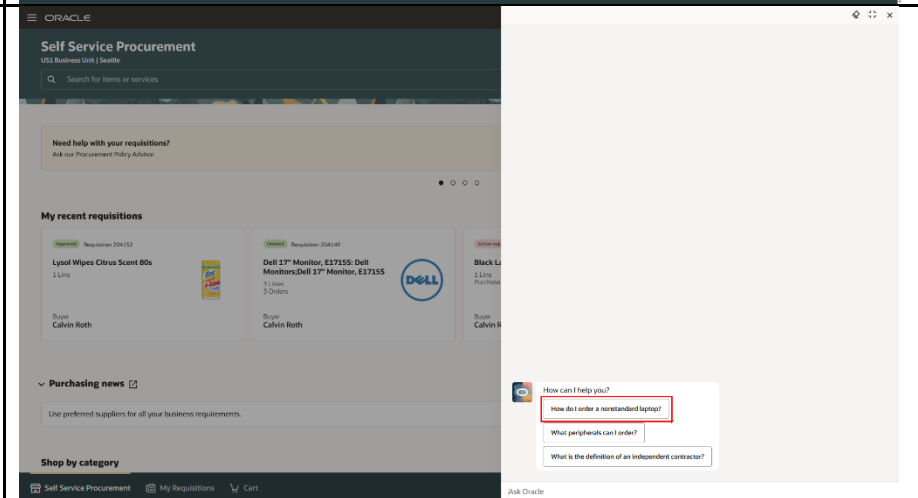

From here, you can view the details around your recent requisitions and see brief details of their status and where they are at in the requisition process. This is also the area where you can search the entire catalogue of items.

Clicks:
Click on 'Ask Oracle' for the Procurement Policy Advisor

Because he is unsure what he's allowed to order, he utilizes the Procurement Policy Advisor. This is an embedded agent that users can talk with to find more information around the company's procurement policies including what items they are allowed to order, warranty information, etc.

Clicks:
Click on 'How do I order a nonstandard laptop?'

The agent pulls in the necessary information from the procurement policy documents and provides information around how to order specific items, like a non-standard laptop. These documents can be hundreds of pages long, so have an embedded AI agent to retrieve the necessary information is a huge time saver.

The agent then lists out the step-by-step process for ordering a non-standard laptop.

Clicks:
Click on 'Sources.'

The tool will also provide sources so users can view the actual documentation that outlines the specific policy that is relevant to their request.

Clicks:
Click on the first source to see the actual source text.

The screenshot displays the Oracle Self Service Procurement interface. The top navigation bar includes 'ORACLE' and 'Self Service Procurement'. The main content area is divided into several sections: 'Need help with your requisitions?', 'My recent requisitions', 'Purchasing news', and 'Shop by category'. The 'My recent requisitions' section shows a list of requisitions, including a Dell 17" Monitor and a Black Laser Printer. The 'Sources' panel on the right lists available suppliers and their contact information.

You are able to ask it questions about the conversation to get more context or find more information.

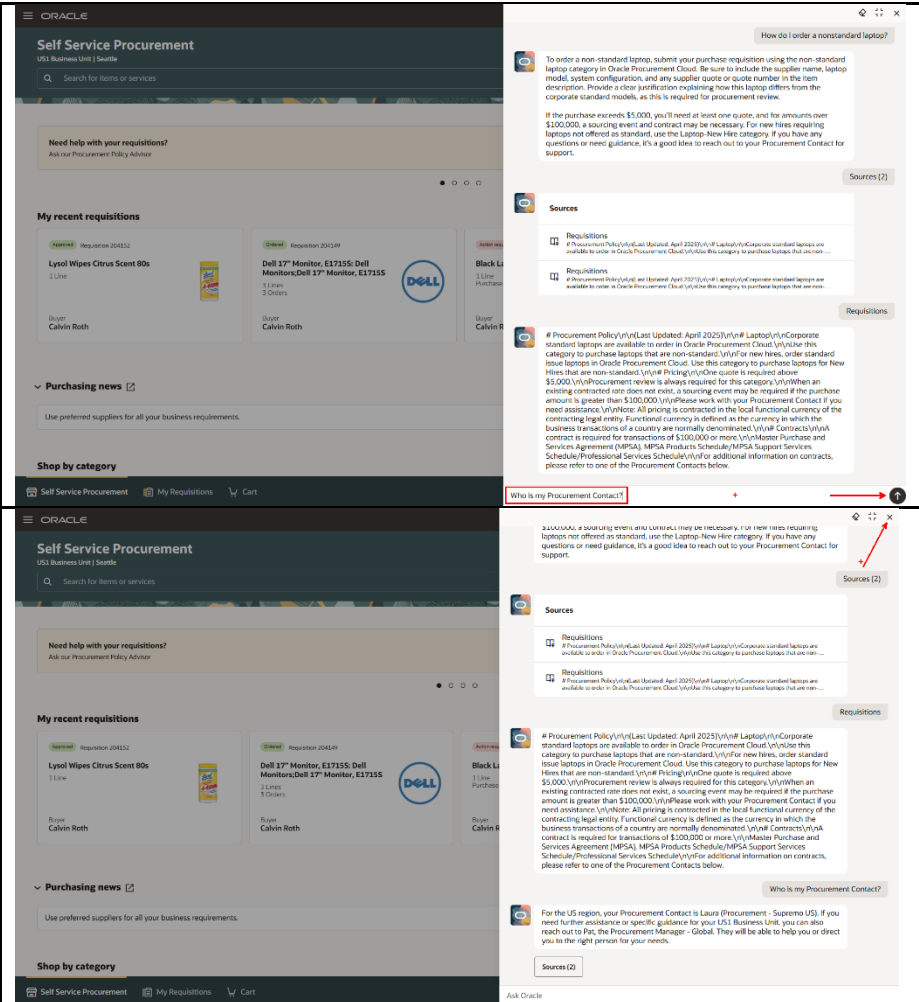

Clicks:
Ask "Who is my
Procurement Contact?"

We will not go through the order process in today's flow since everyone is using currently logged in with the same user so far.

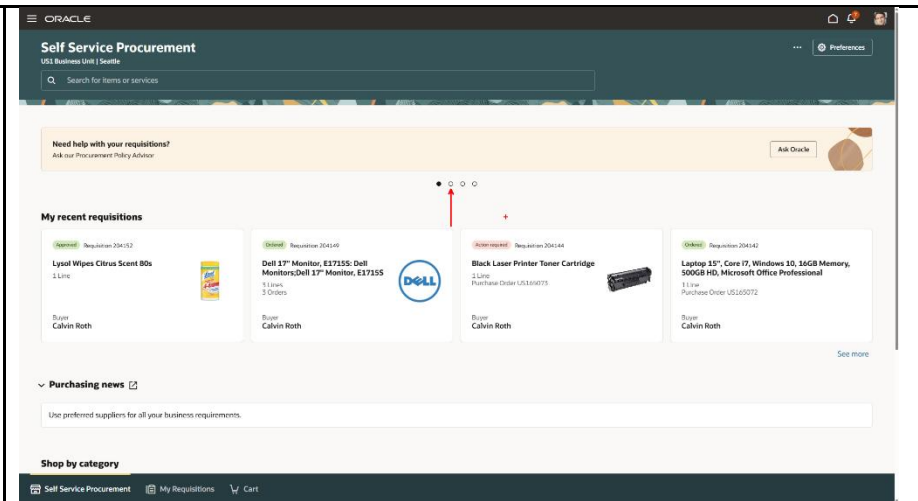

Instead, we see that the laptop has been ordered, and we want to check on the status of the requisition.

Clicks:
Close the chat by clicking the 'x' in the top right corner.

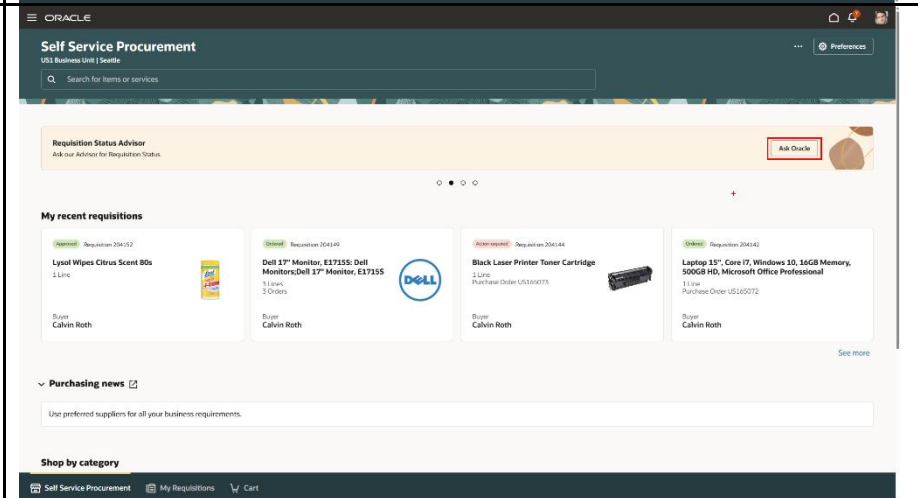

Casey is going to use another agent that's embedded into the requisition dashboard: The Requisition Status Advisor.

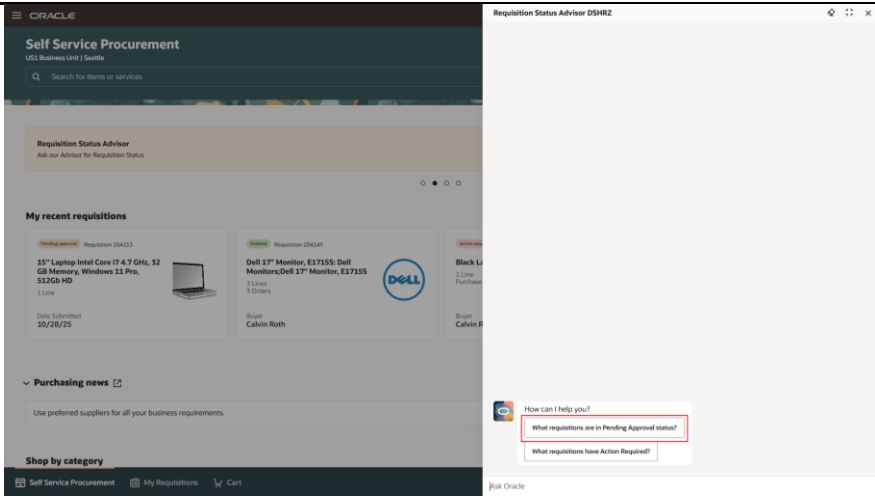

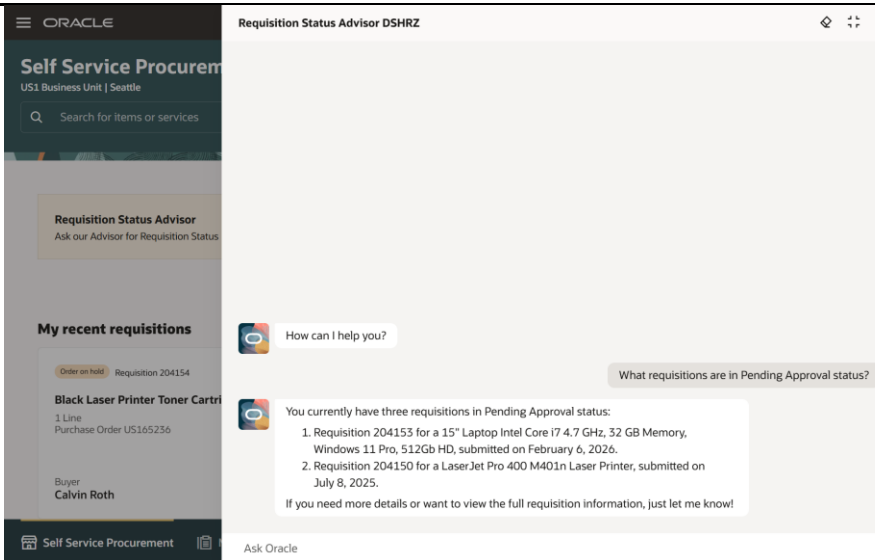

Clicks:
Select the second banner item by clicking on the second dot under the banner.

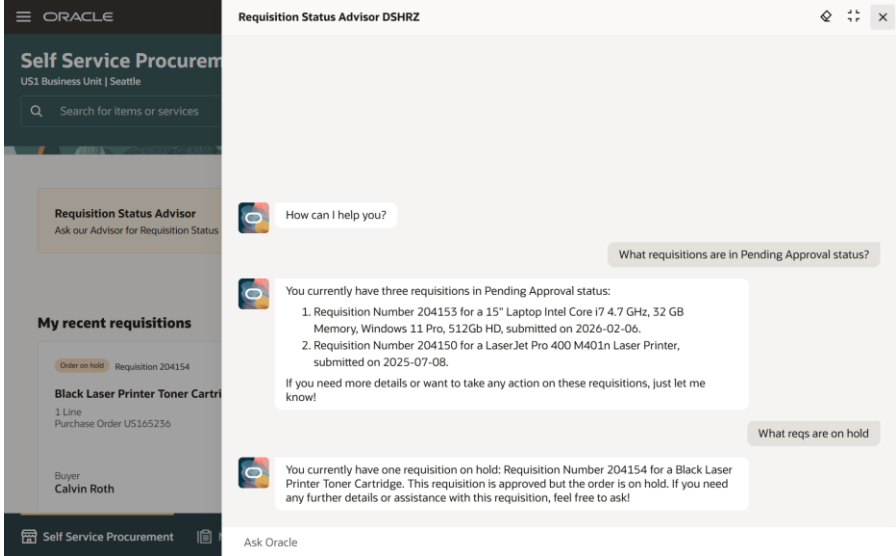

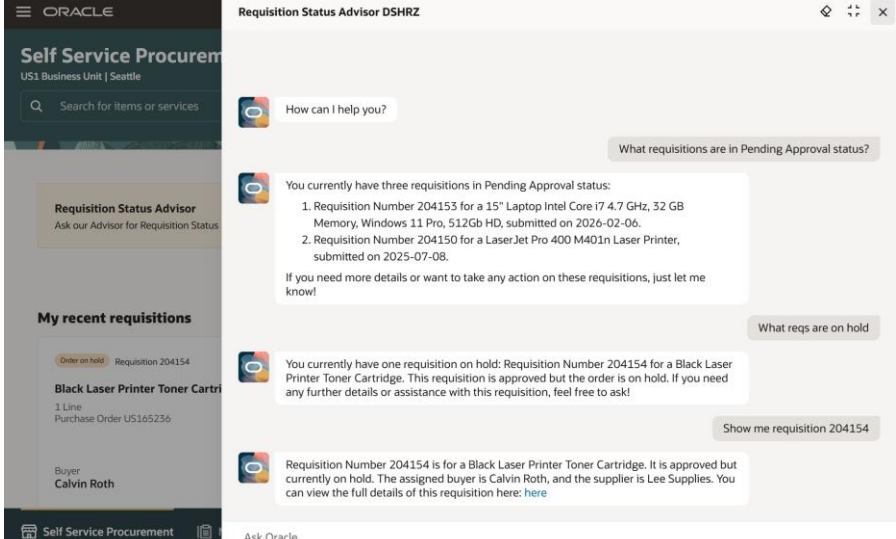

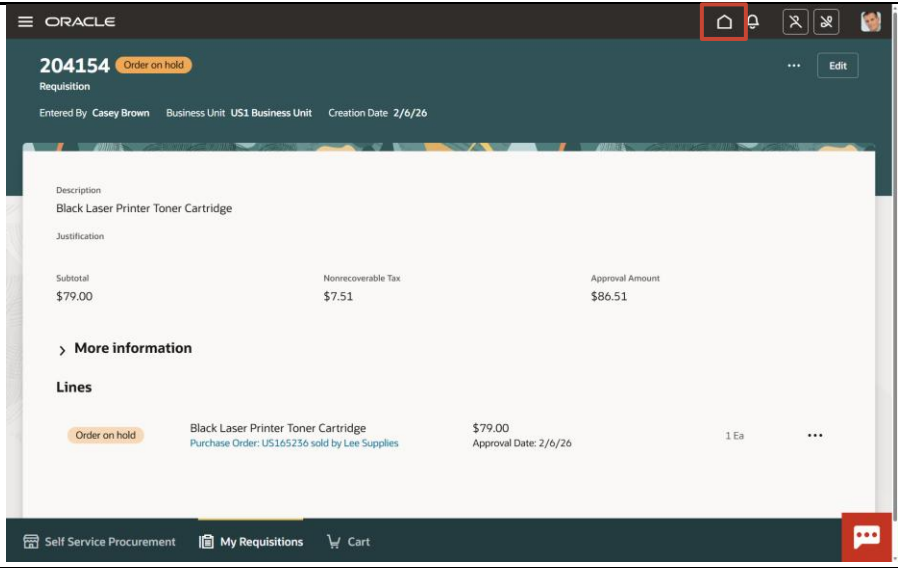

The advisor provides details around open requisitions. It can be used by end users that are actively requisitioning items, or by a procurement specialist that is responsible for hundreds of requisitions.

Clicks:
Click on 'Ask Oracle' for the Requisition Status Advisor.

It makes it much easier to find requisitions that need action taken. The tool will pull up all requisitions that apply to the prompt a user types in.	<i>Clicks:</i> Select “What requisitions are in pending approval status?” <i>Troubleshooting: if the agent does not come back with a response close it and re-open and ask the question again.</i> 	
The requisition for the laptop ordered will pop up with full details and you have the ability to drill into the requisition.	<i>Clicks:</i> OPTIONAL, click the hyperlinked ‘here’ option to view the requisition. Once complete, close the browser tab and return to the tab with the agent. 	

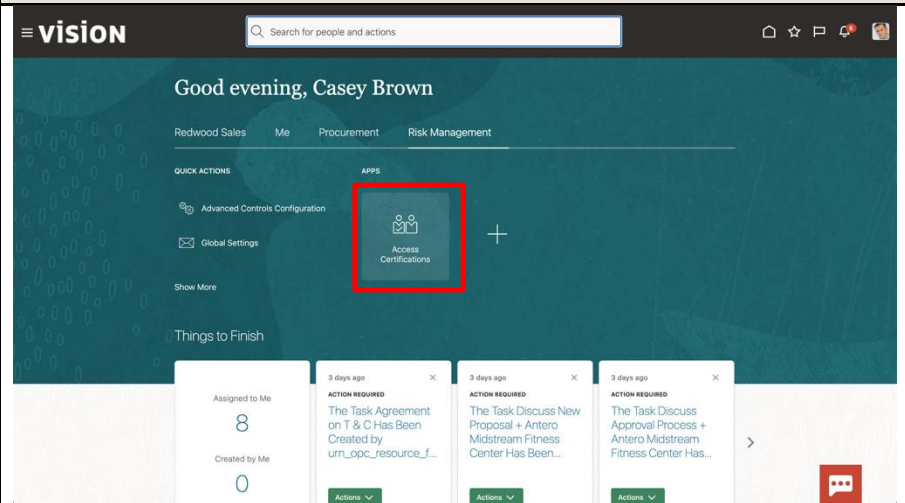

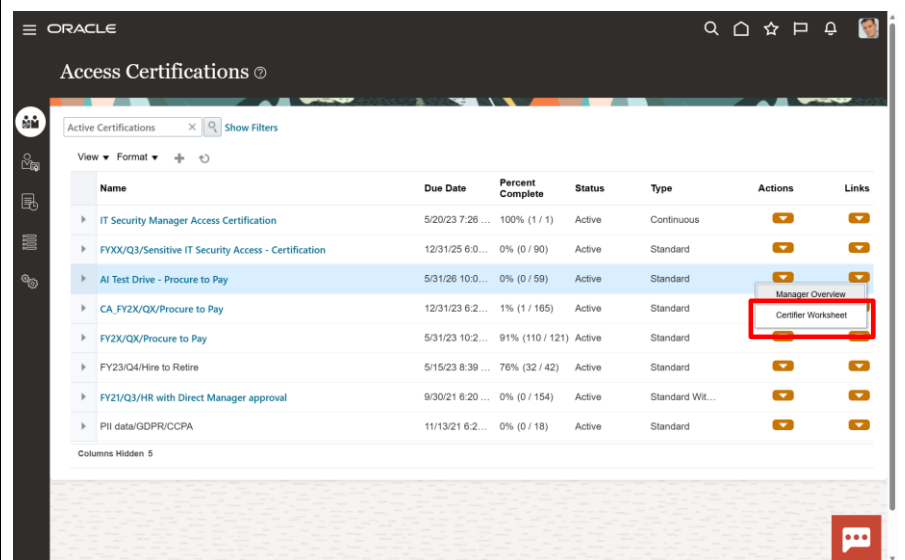

While he is in here, he wants to view other requisitions that require action. This allows him to either take direct action or reach out to the right person that can fix the issue. The AI tools within the system can understand natural language, so there is no need to talk like a robot.	Clicks: Type in the Ask Oracle bar “what reqs are on hold” Troubleshooting: if the agent does not come back with a response close it and re-open and ask the question again. 	
	Clicks: Type in the Ask Oracle Bar “Show me requisition 204213” and click on the link provided 	

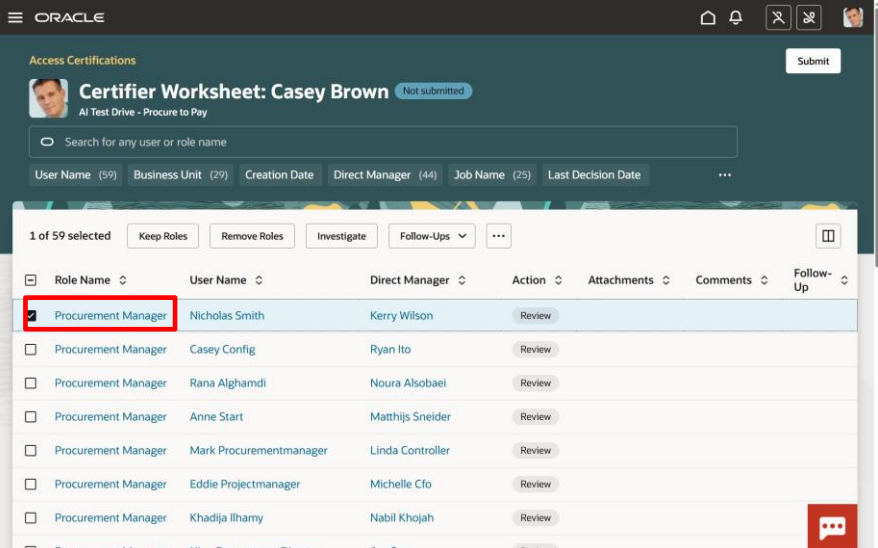

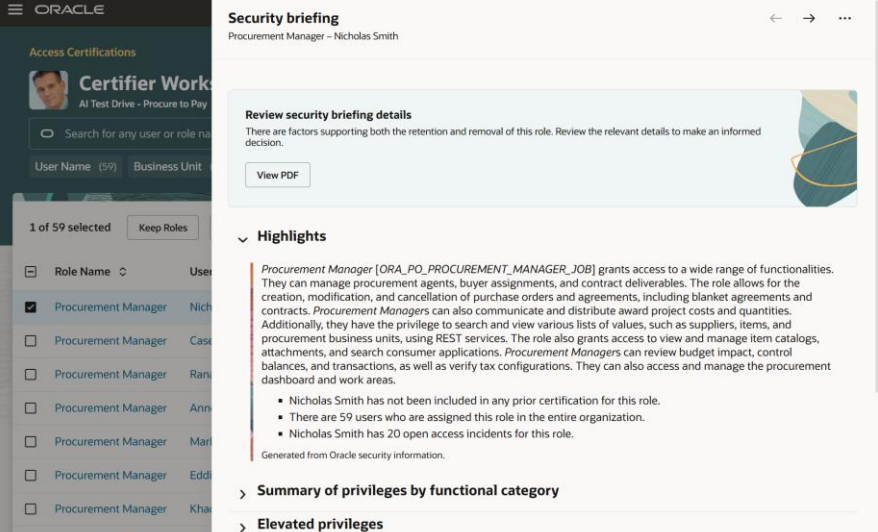

You could now view more details regarding this requisition, edit the requisition, and confirm receipt of the items once received so the invoice can be paid to the Supplier. This is not something we will do in today's lab. Instead, as Casey has finished researching his requisitions, he now wants to ensure that the correct people in his organization have appropriate access to the requisition tools.	<i>Clicks:</i> <i>OPTIONAL, view more information around the requisition as well as more details around the item.</i> <i>Click the Home button</i>	 The screenshot shows the Oracle Requisition interface. At the top, there is a navigation bar with a home button (house icon) highlighted by a red box. Below the navigation bar, the requisition details are displayed, including the requisition number 204154, the status 'Order on hold', and the description 'Black Laser Printer Toner Cartridge'. A summary table shows the Subtotal (\$79.00), Nonrecoverable Tax (\$7.51), and Approval Amount (\$86.51). Below this, there is a 'More information' section with a 'Lines' table showing the requisition line details, including the item description, quantity, and price.
--	---	--

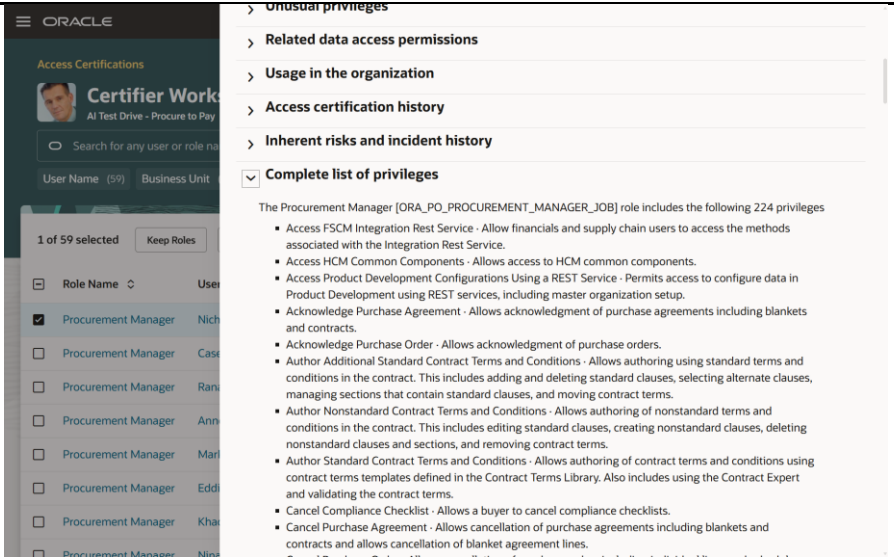

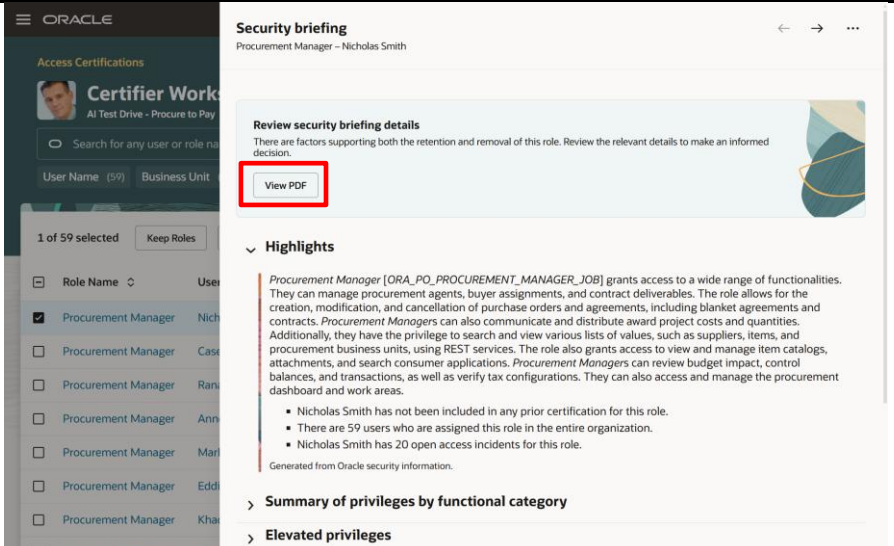

Purchase Requisition Guidance

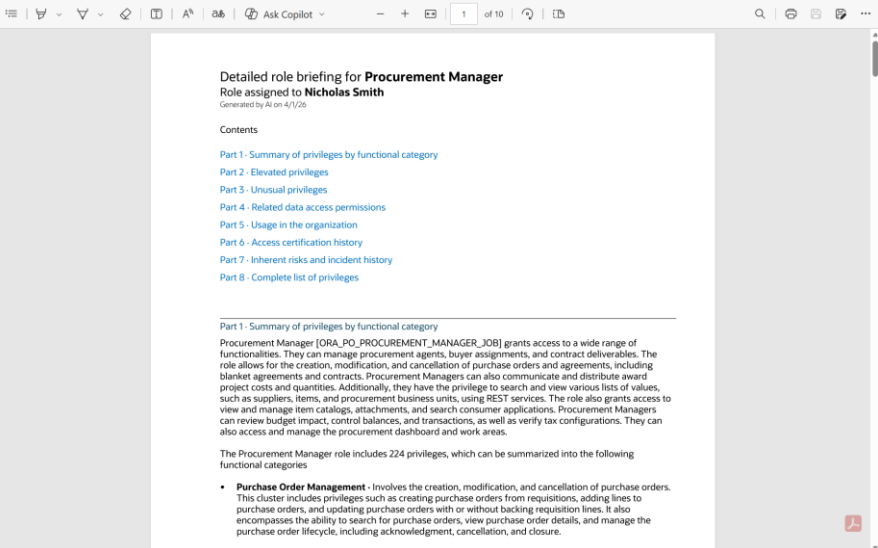

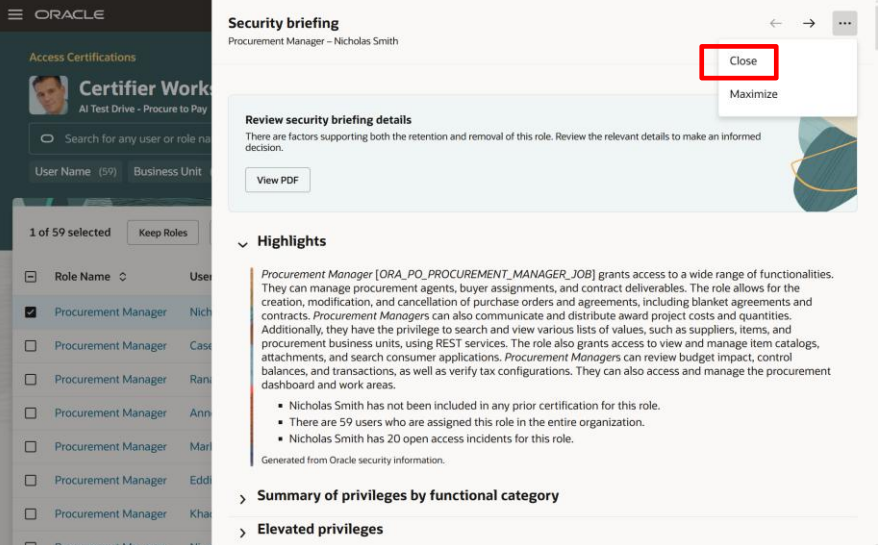

In this exercise, you learnt how to work with AI Agents to be more compliant by talking to the policy advisor, and to have a quicker overview through a conversation in natural language.

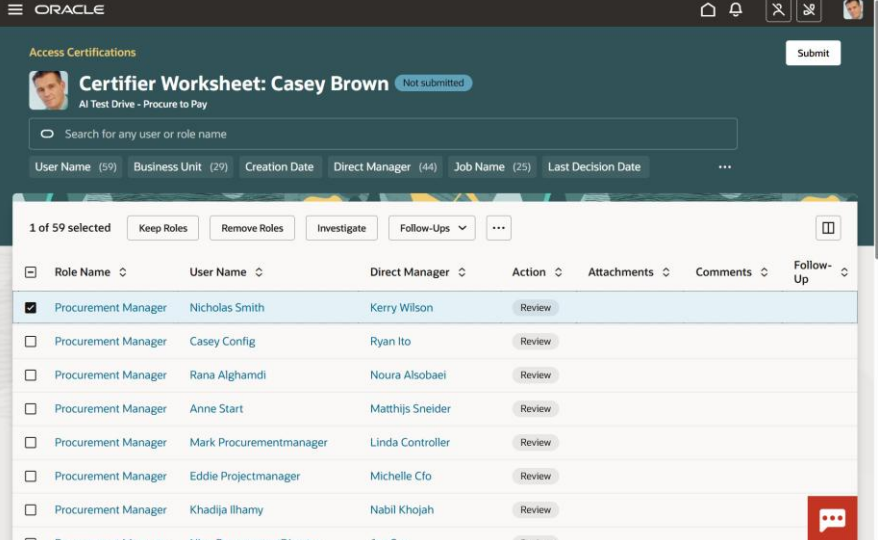

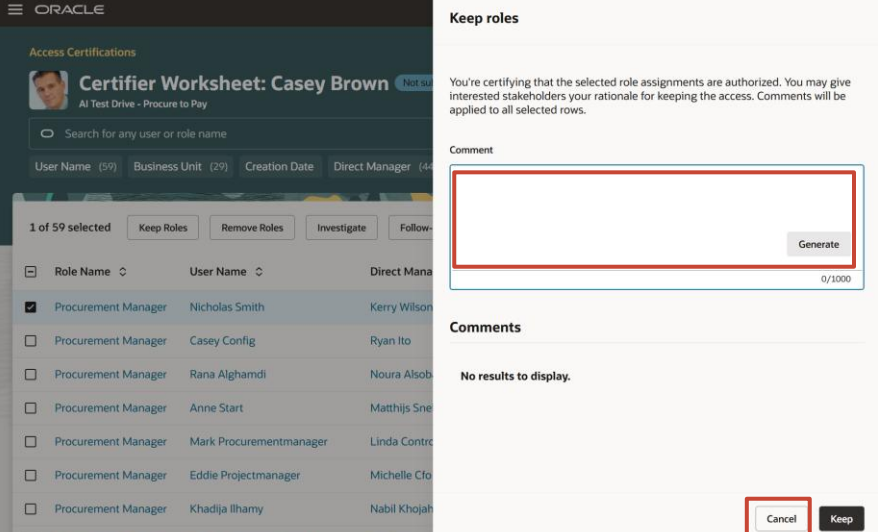

Exercise 1-4: Separation of Duties (Risk Management, ERP)

Background	Participant Action	Display
As part of quarterly controls, Casey needs to certify that only authorized team members can create purchase requisitions. Instead of combing through spreadsheets or multiple reports, he accesses the Access Certification that utilizes AI for embedded insights and GenAI briefings to surface risks and speed decisions.	Clicks: Click on Risk Management-> Access Certifications	
	Clicks - Find the row 'AI Test Drive Procure to Pay' - Link - Dropdown arrow - Select Certifier Worksheet	

In the Certifier worksheet, where you can see all users who have access to creating a purchase requisition and their assigned roles in one place and an indicator of pending actions. Click one of the role names to open the AI powered role briefing.	<i>Clicks:</i> <i>Click on Role Name on any row with action of review</i>	
Instantly, you get a plain-language summary of what that role allows — in this case, the ability to create purchase invoices — plus how many users currently have it and if any separation-of-duties conflicts exist. No need to interpret technical privileges or switch to another report — the GenAI summary gives you everything in context.		

You can expand additional sections like Summary of Privileges, Usage in the Organization, and Inherent Risks to see details like functional breakdowns or potential conflicts with other access areas. Based on this context, you can now make a quick, confident decision — whether to Keep or Remove the role — and provide a short justification directly in the worksheet. The GenAI summary gives the full story behind each access decision, right where it is needed, helping to close out certifications faster and with stronger audit confidence.	<i>Clicks:</i> <i>Scroll down and expand additional sections such as – Complete list of privileges</i>	 The screenshot shows the Oracle Access Certifications interface. On the left, a list of roles is displayed, with 'Procurement Manager' selected. On the right, the 'Complete list of privileges' section is expanded, showing a list of 224 privileges for the 'Procurement Manager [ORA_PO_PROCUREMENT_MANAGER_JOB]' role. The list includes various permissions related to FSCM, HCM, and contract management.
If the sales manager or an auditor ever needs detailed evidence, you can instantly export this entire Role Briefing as a formatted report package — no manual screenshots or separate documentation required. With just one click, the system generates a comprehensive PDF containing all of the same insights — the AI-generated summary, privilege details, usage history, and risk indicators — neatly organized by section.	<i>Clicks:</i> <i>Scroll back to the top of the Security Briefing</i> <i>Select View PDF</i> 	 The screenshot shows the Oracle Access Certifications interface. On the left, the same list of roles is displayed. On the right, the 'Security briefing' section is expanded, showing a 'Review security briefing details' card. A red box highlights the 'View PDF' button on this card. Below the card, there are 'Highlights' and a 'Summary of privileges by functional category' section.

The export automatically stamps the date and confirms it was ‘Generated by AI on today’s date’, giving a clear audit trail of when and how the review was performed. This packaged report becomes part of the certification record, making it easy for auditors to validate access reviews without additional follow-up or clarification requests. That means less administrative work and more confidence that the access certification is fully documented, compliant, and ready for audit	Clicks: <i>Open downloaded report</i>	
	Clicks: <i>Navigate back to the Risk Management browser window</i> <i>Click ‘...’ and select ‘Close’ to get out of the security briefing and go back to certifier worksheet homepage</i>	

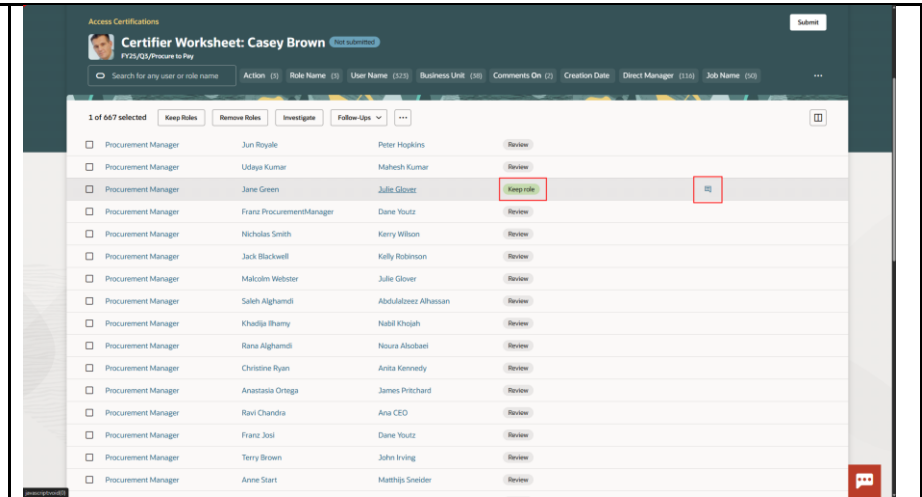

After reviewing the AI-generated briefing and confirming the access is still appropriate, Casey decides to keep the role for the user.	<i>Clicks:</i> 1. <i>Click the row for the user we just reviewed</i> 2. <i>Click on Keep Roles</i>	
This immediately records the certification decision with timestamp, comment, and user context — all automatically tracked for audit. Simple, guided, and fully documented within the same view.	<i>Clicks:</i> 1. <i>Leave a comment such as "retain invoice creation access"</i> 2. <i>Click on 'Generate' to use AI to suggest the Comment.</i> 3. <i>Cancel to preserve the role for others to test.</i>	

In just a few clicks, you completed the access review — backed by GenAI explanations, automated evidence capture, and one-click export for audit packages.

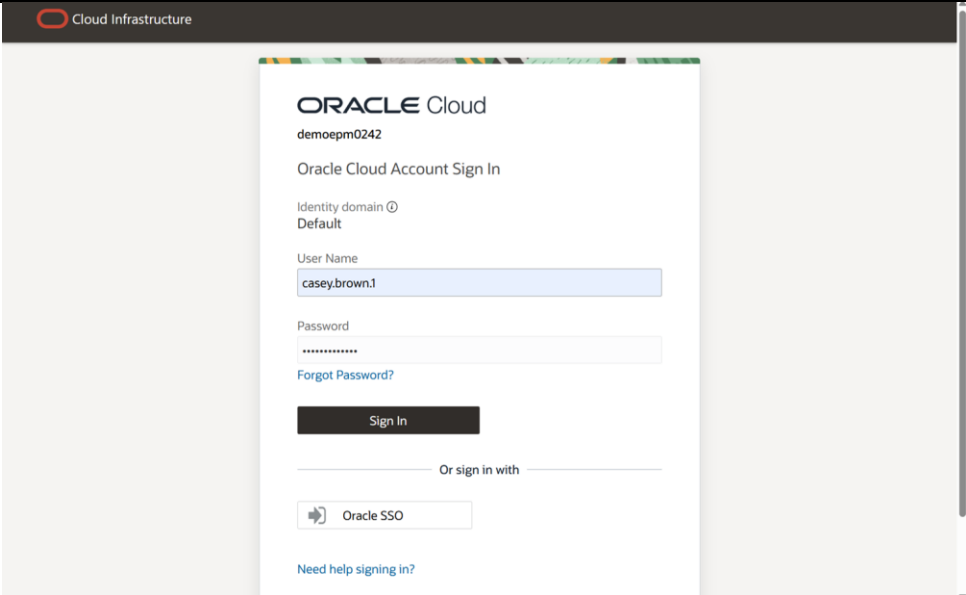

The result: faster certifications, fewer compliance gaps, and a complete digital trail that’s always ready for auditors — all without leaving Oracle Cloud.

If Casey had up kept his action to “Keep roles”, the status would be updated and comment icon populated for audit trail.

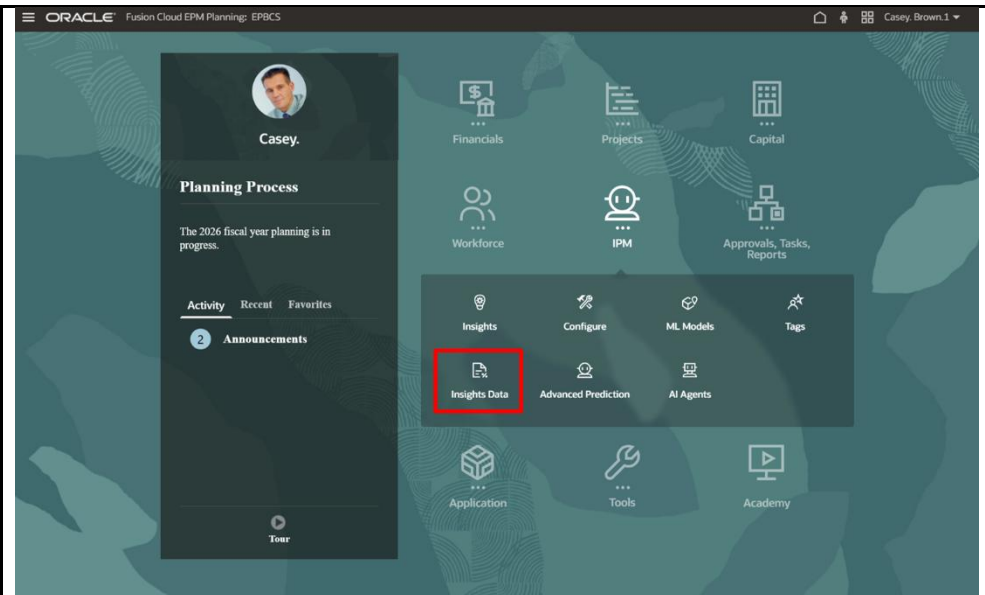

Separation of duties

In this exercise, you learnt how to use another summarisation agent and to follow a set of checkpoints, before also using generative AI to help justify a decision by writing a more fluent comment matching your corporate language style.

Exercise 1-5: Anomaly Insights (Enterprise Performance Management, EPM)		
Background	Participant Action	Display
Login to the Oracle Cloud EPM: https://epm10242plan-demoepm0242.epm.eu-frankfurt-1.ocs.oraclecloud.com/HyperionPlanning Each workshop attendee is assigned a dedicated demo user, from Casey.Brown.1 to Casey.Brown.50. Throughout the workshop instructions, screenshots use Casey.Brown.1 as an example.	Login with the following credentials: User ID: Casey.Brown.x Password: Use the environment password <i>Replace "casey.brown.x" with the user assigned to you (for example, "Casey.Brown.8").</i>	

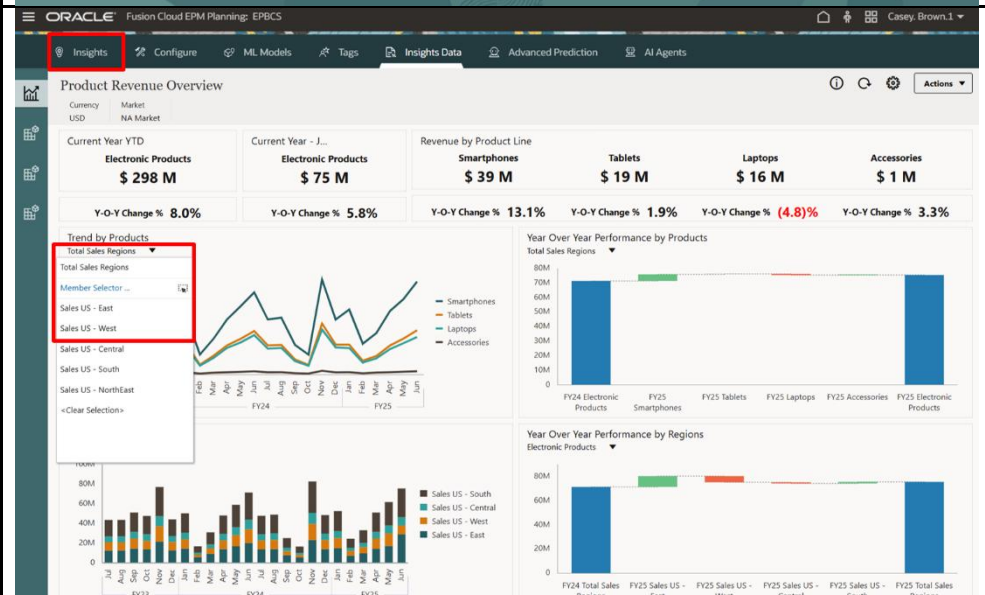

After data for a period is finalized, Casey begins the performance review process. Let's see how the Insights provide items for action and facilitate collaboration across various stakeholders.

Clicks:
Click on **IPM** -> **Insights Data**.

The dashboard highlights revenue performance across regions and major product lines. Change the drop down on the line graph from “Total Sales Regions” to “Sales US - East” and “Sales US - West.” It seems the revenue for “Sales US - East” has increased while in contrast “Sales US - West” shows declining revenue. This situation requires further investigation. Let's review this leveraging the Insights.

- Clicks:
1. On the line graph, click on the drop down titled “**Total Sales Regions.**”
 2. Select “**Sales US - West**” and review.
 3. Select “**Sales US - East**” and review.
 4. When finished, click on the **Insights** tab on the horizontal bar above the dashboard.

All the Insights generated are brought together onto the Insights dashboard. This is a highly curated set of Insights that are very accessible for a business user.

The application is making the artificial intelligence (AI) very user-friendly. When the Insights are configured, the priority can be determined as high, medium, or low. Both the Value and % variances are shown along with the data intersections of related data and the type of variance - a Prediction, Forecast Bias, or Anomaly.

This exercise will focus on just the Anomaly type. There is also have a high-level explanation of the Insight, its status, and when it was created.

Clicks:

1. Scroll down to review the listing of Insights.
2. Read a few of the rows of Insights.

					Actual Capital Expenditure 19.6% higher than forecast	Open
					Actual Total Travel and Entertainment Expense	Open

The model has generated an anomaly for Sales US Eastern region's "Smartphones" products. This product portfolio has several product lines, and the anomaly is generated at total level.

Clicks:
1. Click the **Details** link to open the selected Insight.

Priority	Impact	Value	POV	Type	Details	Status
High	41.1%	\$8M	Sales US - East-Smartphones Premium	Anomaly	Actual Product Revenue 139.4% higher in Jun FY25	Open
High	39.4%	\$10M	Sales US - East-Smartphones	Anomaly	Actual Product Revenue 130.2% higher in Jun FY25	Open

On the chart, the orange line is the Actual revenue, and the system has automatically detected that there's been a spike in the revenue – a very unusual spike. The system is doing a lot of hard work behind the scenes in identifying the spike. Just because there is a usual spike in Q4, it's not going to identify that as an anomaly. It's only going to identify the true anomalies in the system, unusual patterns that deviate from expected results. This is useful information – it might make sense to contact the people responsible for this sales territory and channel because the spike is very specific.

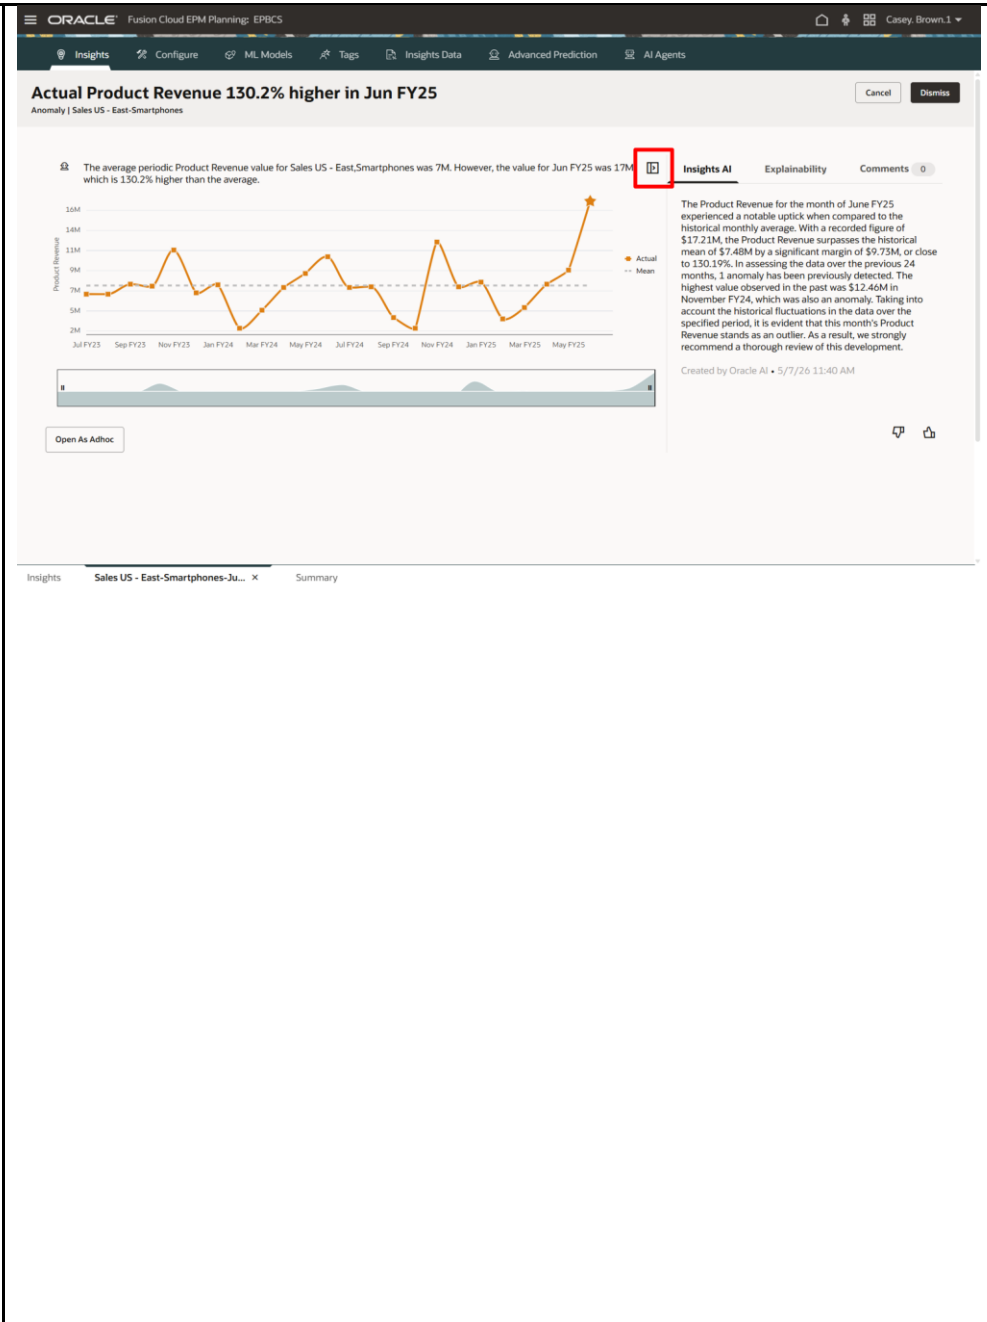

The analysis is not just the overall spikes, but spikes across a multi-dimensional model, and maybe there's something about this territory or channel or product where something has changed to create this increase in revenue. If this trend continues, it might be possible to learn from it for other territories or channels.

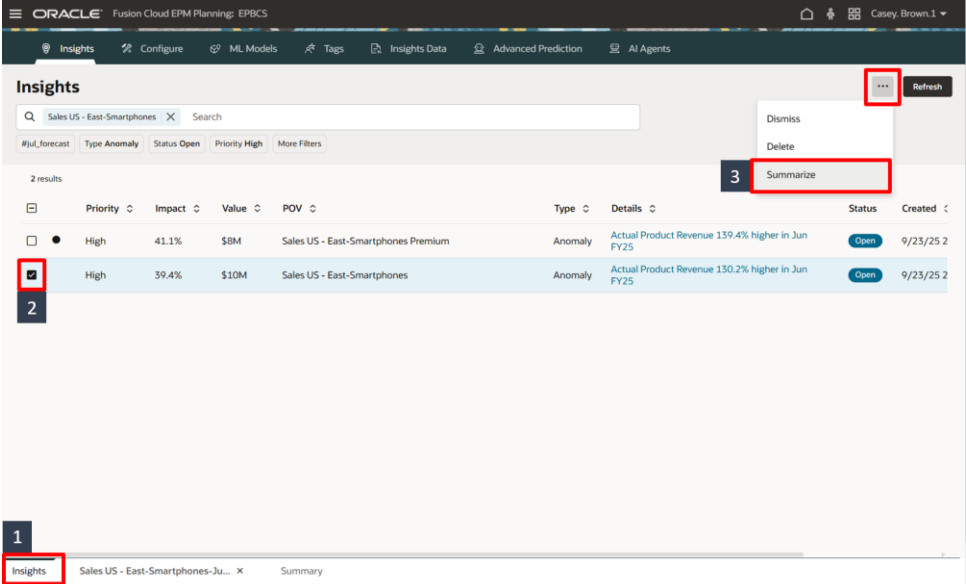

Casey notices the spike in the trend line and reviews the narration generated automatically by the Insights using Generative AI (GenAI).

The Insights AI tab uses GenAI to automatically generate narrative summaries (for a single Insight

Clicks:

1. Hover over the data point represented as a star at the far-right hand side of the line graph.
2. Click on the  icon at the top right-hand side of the line graph to expose the explanations panel from the right-hand side of the chart.
3. Review the **Insights AI** tab. It contains a narrative explanation of the anomaly generated by AI.

or group of Insights). For a single Insight, GenAI evaluates the existing analysis, metrics, methods, and rule-based summary, and using Large Language Models (LLMs), generates a meaningful narrative description about the Insight.		
Casey seeks to determine what drove Sales East's exceptional results. He utilizes GenAI to create a summary that identifies which specific products and lines were responsible for this unusual performance. Insights also provides the ability to use GenAI to automatically generate narrative summaries for a parent level Insight. The entities, products, and other members contributing to an anomaly are automatically detected and summarized in a clear, easy-to-review narrative.	<i>Clicks:</i> <i>To get to the screen on the right navigate back to Insights listing page by clicking on the Insights tab at the bottom-left hand side of the screen.</i> <i>Select the Insight by putting a check mark into the box for the Insight.</i> <i>Open the More Actions dropdown and select Summarize.</i>	

Based on the selected insight, Gen AI generates a narrative summary for the selected entity and product category. The summary reviews the relevant products based on the selected hierarchy and includes the key data points to help explain the drivers behind the anomaly.

Clicks:

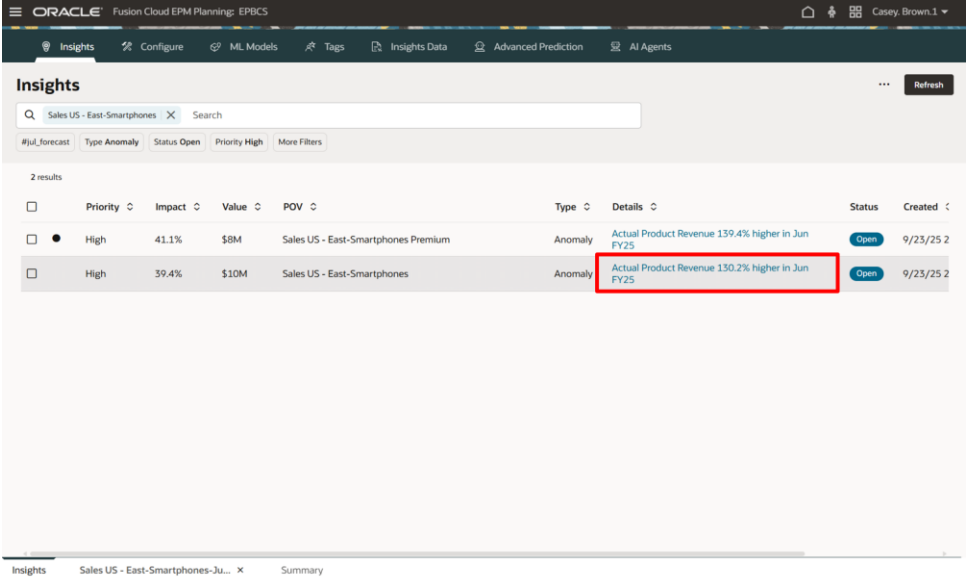

1. Provide a name for the Summary that includes your initials. (i.e., “**XXX Smartphones**”)
2. Select the **Anomaly Insight Type** from the dropdown.
Other parameters are automatically populated based on the Insight selection.
3. Click **Run**.
(It may take a short time to complete the GenAI summary.)

Casey is presented with a ready-to-use summary explaining how the performance at individual entity / product level contributed to the overall anomaly. This summary helps Casey zero in on the root cause for the Insight and makes it easy to collaborate across functions. Some of the product lines have contributed significantly for the anomaly. This summary can be taken to reports and/or presentations as ready to use content with all relevant data points.

Clicks:

1. Click on the **Summary** tab at the bottom-left side of the screen to see a list of different summaries.
2. Click **Refresh**. It might take a few seconds for the summary to appear.
3. Find your summary in the list and open the summary by clicking on its name.
4. After review, close the summarized text by clicking on the **X** in the top-right corner.

	Clicks: 1. Click on the Insights tab at the bottom of the screen to get back to the Insights page. 2. Click again on the Details link to see the contents of the Insight again.	 The screenshot displays the Oracle Fusion Cloud EPM Planning: EPBCS interface. The top navigation bar includes tabs for Insights, Configure, ML Models, Tags, Insights Data, Advanced Prediction, and AI Agents. The main section is titled 'Insights' and features a search bar with the query 'Sales US - East-Smartphones'. Below the search bar, there are filters for #jul_forecast, Type Anomaly, Status Open, Priority High, and More Filters. A table shows 2 results. The first result is highlighted with a red box, indicating 'Actual Product Revenue 139.4% higher in Jun FY25' with a status of 'Open' and a creation date of 9/23/25. The second result shows 'Actual Product Revenue 130.2% higher in Jun FY25' with a status of 'Open' and a creation date of 9/23/25. The bottom of the screen shows a breadcrumb trail: Insights > Sales US - East-Smartphones-Ju... > Summary.

Casey adds his comments to the Insight providing additional reasoning for the anomaly. Tagging is also enabled in comments with # (hashtags). Casey can include # (hashtags) in comments, containing relevant key words, which then can be used to filter the Insights.

Clicks:

1. Click on the  icon at the top right-hand side of the line graph to expose the panel from the right-hand side of the chart.
2. Click on the **Comments** tab to expose the ability to enter comments for the Insight.
3. Copy and paste from the comment below or type a similar comment using # (hashtags) into the **Enter Comments** text box:

“The new #Aldriven targeted #marketcampaign proved to be a big hit with significant sales in Smartphones.”
4. Click the **Post** icon.

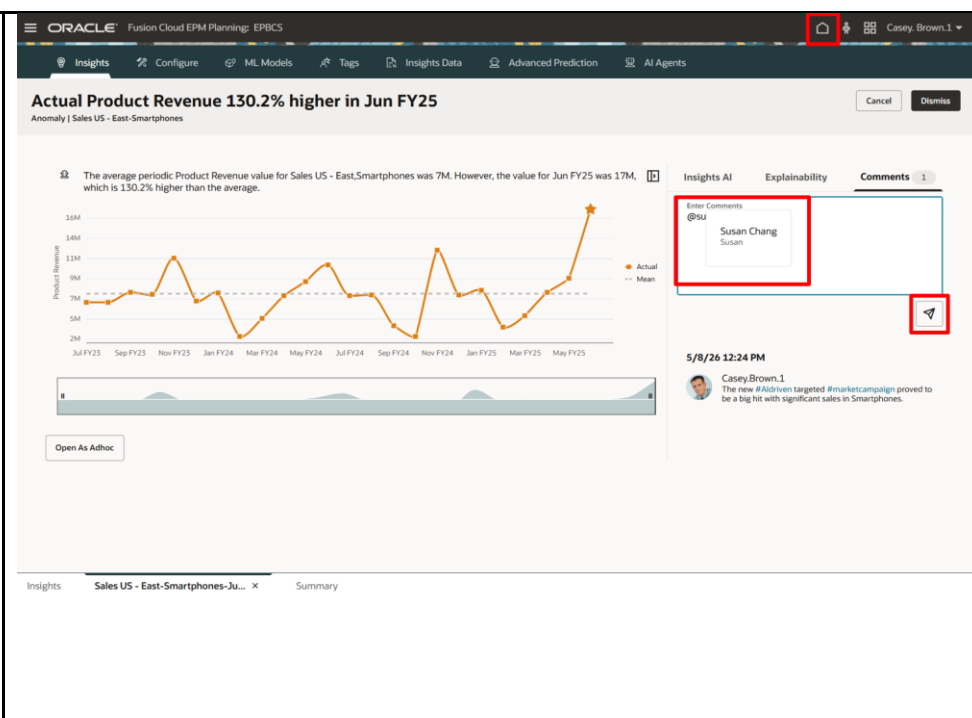

Casey decides to ask Susan Chang to review the Insight as well.

Casey navigates back to the home screen to start another analysis.

Clicks:

1. Start by typing “@Su” in the Enter Comments text box. Then choose “**Susan Chang**” from the list that pops up. Add more comments asking Susan to review the Insight and click **Post**. The user tag becomes a filter for Susan to use to focus on only the Insights where she is tagged.
2. When finished, click on the **Home** icon  in the far upper right-hand area of the screen to be taken back to the home screen.

Anomaly Insights

In this exercise, you learnt how to use Insights to identify anomalies, explore root causes, and generate AI-driven narrative summaries for performance analysis.

Congratulations!! You have completed the **Lab 1** set of embedded AI flows.

Summary

By completing these steps, you have explored just a few of the AI features available as standard in Fusion Cloud Applications, designed to boost your productivity and deliver a more engaging experience. Leverage the power of AI to shape the future of work!

You have successfully completed the Activity!
